WGen7500DF
Dual Fuel Portable Generator
GASOLINE: 7500 Running Watts | 9500 Peak Watts
PROPANE: 6750 Running Watts | 8550 Peak Watts
WARNING

Operating, servicing and maintaining this equipment can expose you to chemicals including engine exhaust, carbon monoxide, phthalates, and lead, which are known to the State of California to cause cancer and birth defects or other reproductive harm. To minimize exposure, avoid breathing exhaust, do not idle the engine except as necessary, service your equipment in a well-ventilated area and wear gloves or wash your hands frequently when servicing your equipment. For more information go to www.P65Warnings.ca.gov.

DISCLAIMERS:
All information, illustrations and specifications in this manual are based on the latest information available at the time of publishing. The illustrations used in this manual are intended as representative reference views only. Moreover, because of our continuous product improvement policy, we may modify information, illustrations and/or specifications to explain and/or exemplify a product, service or maintenance improvement. We reserve the right to make any change at any time without notice. Some images may vary depending upon which model is shown.

ALL RIGHTS RESERVED:
No part of this publication may be reproduced or used in any form by any means – graphic, electronic or mechanical, including photocopying, recording, taping or information storage and retrieval systems – without the written permission of MWE Investments LLC.

DANGER

This manual contains important instructions for operating this generator. For your safety and the safety of others, be sure to read this manual thoroughly before operating the generator. Failure to properly follow all instructions and precautions can cause you and others to be seriously hurt or killed.

NOTICE

Even with a carburetor modification, engine horsepower will decrease about 3.5% for each 300 meter (1,000 foot) increase in altitude. The effect of altitude on horsepower will be greater if no carburetor modification is made. A decrease in engine horsepower will decrease the power output of the generator. Contact our service team to order altitude kits.

IMPORTANT: KEEP YOUR PURCHASE RECEIPT TO ENSURE TROUBLE-FREE WARRANTY COVERAGE.

PRODUCT REGISTRATION
To ensure trouble-free warranty coverage, it is important you register your Westinghouse generator. You can register your generator by either:
1. Filling in the product registration form below and mailing to:
   **Product Registration**
   MWE Investments LLC
   777 Manor Park Drive
   Columbus, Ohio 43228

2. Registering your product Online at wpowereq.com/register
   To register your generator you will need to locate the serial number:

SAFETY DEFINITIONS
The words DANGER, WARNING, CAUTION and NOTICE are used throughout this manual to highlight important information. Be certain that the meanings of these alerts are known to all who work on or near the equipment.

This safety alert symbol appears with most safety statements. It means attention, become alert, your safety is involved! Please read and abide by the message that follows the safety alerts symbol.

DANGER
Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

WARNING
Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION
Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE
Indicates a situation which can cause damage to the generator, personal property and/or the environment, or cause the equipment to operate improperly.

NOTE: Indicates a procedure, practice or condition that should be followed in order for the generator to function in the manner intended.

## GENERAL SAFETY RULES

### DANGER

Never use the generator in a location that is wet or damp. Never expose the generator to rain, snow, water spray or standing water while in use. Protect the generator from all hazardous weather conditions. Moisture or ice can cause a short circuit or other malfunction in the electrical circuit.

Never operate the generator in an enclosed area. Engine exhaust contains carbon monoxide. Only operate the generator outside and away from windows, doors and vents.

### WARNING

Voltage produced by the generator could result in death or serious injury.
- Never operate the generator in rain or a flood plain unless proper precautions are taken to avoid being subject to rain or a flood.
- Never use worn or damaged extension cords.
- Always have a licensed electrician connect the generator to the utility circuit.
- Never touch an operating generator if the generator is wet or if you have wet hands.
- Never operate the generator in highly conductive areas such as around metal decking or steel works.
- Always use grounded extension cords. Always use three-wire or double-insulated power tools.
- Never touch live terminals or bare wires while the generator is operating.
- Be sure the generator is properly grounded before operating.

Gasoline and gasoline vapors are extremely flammable and explosive under certain conditions.
- Always refuel the generator outdoors, in a well-ventilated area.
- Never remove the fuel cap with the engine running.
- Never refuel the generator while the engine is running. Always turn engine off and allow the generator to cool before refueling.
- Only fill fuel tank with gasoline.
- Keep sparks, open flames or other form of ignition (such as match, cigarette, static electric source) away when refueling.
- Never overfill the fuel tank. Leave room for fuel to expand. Overfilling the fuel tank can result in a sudden overflow of gasoline and result in spilled gasoline coming in contact with HOT surfaces. Spilled fuel can ignite. If fuel is spilled on the generator, wipe up any spills immediately. Dispose of rag properly. Allow area of spilled fuel to dry before operating the generator.
- Wear eye protection while refueling.
- Never use gasoline as a cleaning agent.
- Store any containers containing gasoline in a well-ventilated area, away from any combustibles or source of ignition.
- Check for fuel leaks after refueling. Never operate the engine if a fuel leak is discovered.

### WARNING

Never operate the generator if powered items overheat, electrical output drops, there is sparking, flames or smoke coming from the generator, or if the receptacles are damaged.

Never use the generator to power medical support equipment.

Always remove any tools or other service equipment used during maintenance from the generator before operating.

### NOTICE

Never modify the generator.

Never operate the generator if it vibrates at high levels, if engine speed changes greatly or if the engine misfires often.

Always disconnect tools or appliances from the generator before starting.
SAFETY

SAFETY LABELS AND DECALS

1. **MAINTAIN AIR CLEANER**
   
   Rinse with cleaning solvent and dry once every 50 hours (every 5 hours if operating in dusty conditions) and then lubricate to clear engine oil and carbon. Squeeze out excessive oil.

2. **FUEL ON/OFF**
   
   CSA Master Contract Number: MWE Investments LLC Columbus Ohio 43228 USA

3. **FOR TECHNICAL ASSISTANCE or SERVICE CALL TOLL FREE**
   
   1-855-944-3571

4. **DANGER**
   
   Read owner's manual before operating generator on LPG/propane. LPG/Propane is highly flammable. Leaking LPG can cause a fire or explosion if ignited. If you smell propane while you are operating unit, immediately shut off propane valve. Keep propane tank away from exhaust.

5. **WARNING HOT SURFACES**
   
   WARNING: HOT SURFACES

6. **ADVERTENCIA SUPERFICIES CALIENTES**
   
   ¡ADVERTENCIA: SUPERFICIES CALIENTES!

Westinghouse Portable Power | 7
SAFETY LABELS AND DECALS

**DANGER**
Read the owner's manual and follow all safety procedures prior to operating the generator. Failure to follow these instructions may lead to serious injury, property damage or death.

Never fuel the generator when the engine is hot or running. Never allow fuel to come in contact with running engine or hot generator parts. Always allow engine to cool down before adding fuel. Never touch hot surfaces. Generators powered by 3 phase electric systems should not be operated in damp or wet conditions. Keep generator and stored fuel away from sparks and cigarettes. Never connect to a building's electrical system unless a transfer switch has been installed by a certified electrician.

**PELIGRO**
Lea el manual del propietario y siga todos los procedimientos de seguridad antes de hacer funcionar el generador. El incumplimiento de estas instrucciones puede causar lesiones graves, daños a la propiedad o la muerte. Nunca agregue combustible al generador cuando el motor está caliente o en marcha. Nunca permita que el combustible entre en contacto con el motor en marcha o partes calientes del generador. Siempre permita que el motor se enfríe antes de agregar combustible. Nunca toque las superficies calientes. Generadores alimentados por sistemas eléctricos de fase 3 no deben ser operados en condiciones húmedas o mojadas. Mantenga el generador y el combustible alejados del fuego, chispas o cigarrillos. Nunca conecte el sistema eléctrico de un edificio a menos que un interruptor de transferencia haya sido instalado por un electricista certificado.

**WARNING**
Never fuel the generator when the engine is hot or running. Never allow fuel to come in contact with running engine or hot generator parts. Always allow engine to cool down before adding fuel. Never touch hot surfaces. Generators powered by 3 phase electric systems should not be operated in damp or wet conditions. Keep generator and stored fuel away from sparks and cigarettes. Never connect to a building's electrical system unless a transfer switch has been installed by a certified electrician.

**AVERTISSEMENT**

SI VOUS L'APPLIQUEZ À L'ENDROIT D'UN GÉNÉRA
When transporting or servicing the generator:
• Make certain the fuel shutoff valve is off and the fuel tank is empty.
• Make sure the LPG tank and LPG hose is not attached to the generator.
• Disconnect the spark plug wire.

When storing the generator:
• Store away from sparks, open flames, pilot lights, heat and other sources of ignition.
• Do not store gas or LPG tank near furnaces, water heaters or any other appliances that produce heat or have automatic ignitions.

CAUTION
Only use approved LPG tanks with OPD (overfilling prevention device) valve. Always keep the tank in a vertical position with the valve on top and installed at ground level on a flat surface. Do not allow tanks to be around any heat source and make sure it is not exposed to the sun, rain and dust. When transporting and storing, turn off the tank valve and fuel valve, and disconnect the tank. Make sure to always cover the generator and tank outlet with protective plastic caps.

CAUTION
Do not allow children to tamper or play with the propane tank or hose connections.

WARNING
If there is a strong smell of propane while operating the generator close the valve on the propane tank immediately. Once the propane is off, use soapy water to check for leaks on the hose and connections on the tank valve and the generator. Do not smoke or light a cigarette or check for leaks using any open flame source such as a match or lighter. If a leak is found contact a qualified technician to inspect and repair the LPG system before using the generator.

When starting generator:
• Make sure that the gas cap, air filter, spark plug, fuel lines and exhaust system are properly in place.
• If you spill any gasoline on the tank, allow it to fully evaporate before operating.
• Make sure the generator and propane tank are on a flat surface before operating.
• If there is a propane odor do not start the unit because there may be a potential leak.
• Never place propane tank near engine exhaust.
CAUTION

Always have assistance when lifting the generator. The generator is heavy; lifting it could cause bodily harm.

Avoid cutting on or near staples to prevent personal injury.

Tools required – box cutter or similar device.
1. Carefully cut the packing tape on top of the carton.
2. Fold back top flaps to reveal the manual.
3. Remove the Wheel Kit Accessories cardboard box.
4. Carefully cut two sides of the carton to remove the generator.
5. Remove LPG hose from under gas tank.

WHAT COMES IN THE BOX

Manual
Quick Start Guide/Maintenance Schedule
LPG Hose (1)
Wireless Remote Starter (1)
11W Battery Charger, (14V .8A output) (1)
1.1 Liter Bottle of SAE 10W30 Oil (1)
Spark Plug Socket Wrench (1)
Wheel Kit Accessories Box
Funnel (1)

WHEEL KIT ACCESSORIES BOX

Open the Wheel Kit Accessories box and verify the contents against the list right. If any parts are missing, contact our service team at service@wpowereq.com or call 1-855-944-3571.
INSTALLING WHEELS AND FEET

BEFORE ASSEMBLING THE GENERATOR, REVIEW THE SAFETY SECTION STARTING ON PAGE 5.

**CAUTION**

Never lift the generator without assistance. The generator is heavy and lifting without assistance could result in personal injury.

Never use the handles as a lifting point to support the entire weight of the generator. Only use the handles to move the generator by lifting the handles and using the wheels to move the generator.

Use caution when collapsing the handles. Hands and fingers could get caught and pinched.

**NOTICE**

Assembling the generator will require lifting the unit on one side. Make sure all engine oil and fuel are drained from the unit prior to assembling. Once assembled, the wheel kit is not intended for on-road use. The wheel kit is designed for use on this generator only.

INSTALLING FEET TO FRAME

1. Place generator on a flat surface.

2. Place a piece of cardboard or other soft material to tip the generator onto, to protect the frame paint and prevent the generator from sliding. Tip the generator onto the side.

3. Install the mounting foot to the frame using M8 flange bolts.

   1 - Mounting Feet
   2 - Flange Bolts M8

INSTALLING WHEELS TO FRAME

1. Insert axle pin through washer and wheel.

   ![Figure 2 - Wheel Assembly](image)

2. Install the wheel with axle pin through the axle bracket on the frame. The eye of the bolt should be facing toward the inside of the generator.

   ![Figure 3 - Assemble Wheel to Frame](image)

3. Install the hairpin cotter through the axle pin to lock it in place.

   1 - Axle Bracket
   2 - Hairpin Clip
   3 - Axle Pin

4. Repeat previous steps on other wheel.
CONNECTING THE BATTERY

⚠️ WARNING
To avoid electrics shock:
• ALWAYS connect the positive (+) battery cable (red boot) first when connecting battery cables.
• ALWAYS disconnect the negative (-) battery cable (black boot) first when disconnecting battery cables.
• NEVER connect the negative (-) battery cable (black boot) to the positive (+) post on the battery.
• NEVER connect the positive (+) battery cable (red boot) to the negative (-) post on the battery.
• NEVER touch both battery posts simultaneously.
• NEVER place a metal tool across both battery posts.
• ALWAYS use insulated or nonconducting tools when installing the battery.

1. Always make sure to attach the positive (+) battery cable first (1) and then the negative (-) cable second (2) (see Figure 4).

2. Securely tighten the positive (+) battery cable (red boot) to the positive (+) battery post. Make sure boot is over battery post.

3. Carefully remove the protective wrapping around the lug of the negative (-) battery cable (black boot).

4. Locate the black negative (-) cable attached to the alternator case, route it to the negative (-) battery post. See Figure 5 below for location of negative (-) cable.

5. Pull back the black boot and securely attach the negative (-) battery cable (black boot) to the negative (-) battery post as shown in Figure 4. Replace the black boot so it protects the cable lug and battery post.

NOTICE
The electric start generator is equipped with a battery charging feature. Once the engine is running, a small charge is supplied to the battery via the battery cables and will slowly recharge the battery.
FEATURES

1 Fuel Selector Switch: Used to select and turn on gasoline or propane fuel source.

2 Push Button Electric Start: Starts and stops the engine.

3 Engine Control Switch/Battery Disconnect: Allows fuel to flow to engine and energizes the ignition system. Also, disconnects battery power when in STOP position.

4 Fuel Cap: Close until clicking sound is heard.

5 Control Panel: Contains the circuit breakers and outlets.

6 Battery: Included for electric start models.

7 Oil Fill Plug/Dipstick: Must be removed to add and check oil.

8 Oil Drain Plug: Must be removed to drain engine oil.

9 Propane Hook Up: Hook up your propane tank with the LPG hose provided to this inlet.

10 Never Flat Wheels: For easy portability

11 Auto Choke: Battery must be hooked up for auto choke to work properly. You can manually adjust the choke if the battery is not connected.

12 Gas Fuel Shut Off Valve: Controls the flow of gas to the engine.

13 Single Piece Handle: Includes rubber grip. Allows you to easily push or pull unit with one hand.
**FEATURES**

14 **Fuel Gauge:** Indicates fuel level.

15 **Spark Plug Boot (Wire):** Must be removed when servicing the engine or the spark plug.

16 **CARB Canister:** Required for models sold into and used in California.

17 **Muffler and Spark Arrester:** Avoid contact until engine is cooled down. Spark arrester prevents sparks from exiting the muffler. It must be removed for servicing.

18 **Alternator Cover:** Gain access to alternator wiring.

19 **Remote Start Pairing Button:** Initiates the remote key fob pairing function.
**FEATURES**

### CONTROL PANEL FEATURES

1. **Fuel Selector Switch**: Select and turn on gas or propane.

2. **Push Start Button**:
   - Push for 1 second to automatically start the engine.
   - Push for 1 second again to stop the engine.

3. **Engine Control Switch/Battery Disconnect**: Switch to **STOP** to stop the engine. When in **STOP** position it prevents the unit from drawing power from the battery. Switch to **RUN** before starting engine.

4. **5V USB Ports**: 5V DC that come in 1 amp and 2.1 amps.

5. **Main Circuit Breaker**: The main circuit breaker controls total output of all outlets to protect the generator.

6. **120-Volt, 20-Amp Duplex GFCI Outlets (NEMA 5-20R)**: Each outlet is capable of carrying a maximum of 20 amps on a single receptacle or a combination of both receptacles.

7. **120/240-Volt, 30-Amp Twist Lock Outlet (NEMA L14-30R)**: Outlet can supply either 120V or 240V output.

8. **Battery Indicator Light**: When light is illuminated, the battery is on.

9. **Smart Switch Outlet**: Connects the Westinghouse ST Switch (sold separately) to the control panel.

10. **Battery Charge Port**: Used to charge the battery when the unit is off (charger included).

11. **Data Center**: The VFT Meter is an LED display that will rotate through volts, frequency, and lifetime run hours. You can press the **MODE** button to cycle through the different displays.

   The frequency and voltage can vary +/- 5% and still be within tolerance.

   - **V 250**: Voltage
   - **F 60**: Frequency in hertz
   - **00:07**: Lifetime run hours

12. **Ground Terminal**: The ground terminal is used to ground the generator.

13. **20-Amp Circuit Breakers**: Each circuit breaker limits the current that can be delivered through the 120-volt duplex outlets to 20amps.
BEFORE STARTING THE GENERATOR

Weather – Never operate your generator outdoors during rain, snow or any combination of weather conditions that could lead to moisture collecting on, in or around the generator.

Dry Surface – Always operate the generator on a dry surface free of any moisture.

No Connected Loads – Make sure the generator has no connected loads before starting it. To ensure there are no connected loads, unplug any electrical extension cords that are plugged into the control panel receptacles.

NOTICE
Starting the generator with loads already applied to it could result in damage to any appliance being powered off the generator during the brief start-up period.

Grounding the Generator – The National Electric Code (NEC), as well as many local electrical codes, may require the generator to be connected to earth ground. The most common application that requires a ground rod is when you are using the generator as a separately derived system to provide back up power to your house. Typically this is when a transfer switch has a switched neutral.

As the generator application has many variables that cannot be determined by the manufacturer of the generator, a licensed electrician will need to determine if a grounding rod is needed.

If a licensed electrician has determined the application requires a ground rod, make sure it is connected to earth ground by connecting the ground terminal on the control panel to earth ground using copper wire (minimum 10 AWG). Consult a qualified electrician for local grounding requirements.

Neutral Bonded: There is a permanent conduct between the generator (stator winding) and the frame.

WARNING
Be sure the generator is properly connected to earth ground before operating. The generator must be grounded to prevent electrical shock due to faulty appliances.

High Altitude Operation
Engine power is reduced the higher you operate above sea level. Output will be reduced approximately 3.5% for every 1000ft of increased altitude from sea level. This is a natural occurrence and cannot be adjusted by engine. Increased exhaust emissions can also result due to increased fuel mixture. Other issues include hard starting, increased fuel consumption and spark plug fouling. Contact our service team 1-855-944-3571 for altitude part kits.

High Altitude Carburetor Kit Part Number: 140545
High Altitude DF Regulator Part Number: 140547
OPERATION

POWERCORD

Using Extension Cords
Westinghouse Portable Power assumes no responsibility for the content within this table. The use of this table is the responsibility of the user only. This table is intended for reference only. The results produced by using this table are not guaranteed to be correct or applicable in all situations as the type and construction of cords are highly variable. Always check with local regulations and a licensed electrician prior to installing or connecting an electrical appliance.

Using Westinghouse Power Cord
Use the extension cord chart to determine the size of the conductor for extension cord applications. Determine the distance of the generator to the appliance on the top line of the chart. Then select the rated amperage of the generator on the left side of the chart. Where the two meet is the size of the conductor required for the application.

When using the WCG25/WCG20 power cord (sold separate) connect to the 120/240V outlet. The opposite end of the power cord is a fan tail receptacle with 2 green receptacles and 2 red receptacles. Each receptacle is rated at 120 volts AC. To balance the load on the generator’s alternator, use the red and green identifiers on the fan tail receptacle. To keep the load balanced, connect the loads so that both color receptacles are used. An example is one in red and one in green. Do not connect 2 in red and none in green, or 2 in green and none in red. If only one color receptacle is used with multiple loads, the alternator may experience an unbalanced load, causing undue vibration to generator.
OPERATION

CONNECTING THE GENERATOR TO A BUILDING ELECTRICAL SYSTEM
It is recommended to use a manual transfer switch when connecting directly to a building's electrical system. Connecting a portable generator to a building's electrical system must be in strict compliance with all national and local electrical codes and laws, and be completed by a qualified technician.

TRANSFER SWITCH CONNECTIONS
The Westinghouse generator is wired with the neutral bonded to ground. If you are connecting your generator to a panel board transfer switch, a licensed electrician will need to consider removing the bonded neutral to ensure proper operation of household GFCI circuits. Begin by removing the alternator cover (18 on page 14). Once the cover is off remove the nut that holds the bonded ground jumper wire (see “2” in Figure 6). Once the nut is removed take the bonded jumper wire off and re-secure the nut. Next remove the screw holding the neutral ground wire (see “1” in Figure 6). Attach the bonded jumper wire (2) to the neutral ground (1) and tighten the screw.

If the bonded neutral is removed the generator must be relabeled as floating neutral on the control panel.

If your generator is equipped with GFCI receptacles, removing the bonded neutral may not allow proper operation of the GFCI receptacles. Always keep the jumper wire in case it is needed for future use when not connected to a transfer switch.

ADDING / CHECKING ENGINE FLUIDS AND FUEL
BEFORE ADDING/CHECKING ENGINE FLUIDS AND FUEL, REVIEW SAFETY SECTION STARTING ON PAGE 5.

DANGER
Filling the fuel tank with gasoline while the generator is running can cause gasoline to leak and come in contact with hot surfaces that can ignite the gasoline.

Before starting the generator, always check the level of:
• Engine oil
• Gasoline in the fuel tank

Once the generator is started and the engine gets warm, it is not safe to add gasoline to the fuel tank or engine oil to the engine while the engine is running or the engine and muffler are hot.

CHECKING AND / OR ADDING ENGINE OIL

WARNING
Internal pressure can build in the engine crankcase while the engine is running. Removing the oil fill plug/dipstick while the engine is hot can cause extremely hot oil to spray out of the crankcase and can severely burn skin. Allow engine oil to cool for several minutes before removing the oil fill plug/dipstick.

The unit as shipped does not contain oil in the engine. You must add engine oil before starting the generator for the first time. See Checking Engine Oil and Adding Engine Oil on page 26 for instructions on checking engine oil level and the procedure for adding engine oil.

NOTICE
The engine does not contain engine oil as shipped. Attempting to start the engine can damage engine components. The owner of the generator is responsible to ensure the proper oil level is maintained during the operation of the generator. Failure to maintain the proper oil level can result in engine damage.

NOTICE
During the first five hours of operation the generator make sure to not exceed 50% of the rated running watts until the unit is broken in properly. Make sure to vary the load occasionally to allow stator windings to heat and cool. Adjusting the load will also help seat piston rings. Check oil more often during the first couple times of operating the generator.

NOTICE
Weather will affect engine oil performance. Change the type of engine oil used based on weather conditions to suit the engine needs.
**OPERATION**

**ADADDING GASOLINE TO THE FUEL TANK**

**BEFORE ADDING GAS TO THE TANK**

**PLEASE REVIEW FUEL SAFETY SECTION ON PAGE 9**

<table>
<thead>
<tr>
<th><img src="" alt="WARNING" /></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WARNING</strong></td>
</tr>
<tr>
<td>Never refuel the generator while the engine is running.</td>
</tr>
<tr>
<td>Always turn the engine off and allow the generator to cool before refueling.</td>
</tr>
</tbody>
</table>

**Required Gasoline** – Only use gasoline that meets the following requirements:

- Unleaded gasoline only
- Gasoline with maximum 10% ethanol added
- Gasoline with an 87 octane rating or higher

**Filling the Fuel Tank** – Follow the steps below to fill the fuel tank:

1. Shut off the generator.
2. Allow the generator to cool down so all surface areas of the muffler and engine are cool to the touch.
3. Move the generator to a flat surface.
4. Clean area around the fuel cap.
5. Remove the fuel cap by rotating counterclockwise.
6. Slowly add gasoline into the fuel tank. Be very careful not to overfill the tank. The gasoline level should NOT be higher than the filler neck (see Figure 7).
7. Install the fuel cap by rotating clockwise until you hear a click, indicating the cap is completely installed.

![Figure 7 - Maximum Gasoline Fill Level](image)

**NOTICE**

- When using standard 20 or 30 pound capacity LPG tanks, make sure they have Type 1, right hand Acme threads.
- Verify the requalification date on the tank has not expired.
- All new tanks must be purged of air and moisture prior to filling. Used tanks that have not been plugged or kept closed must also be purged.
- The purging process should be done by a LPG supplier. (Tanks from an exchange supplier should have been purged and filled properly already)
- Always position the tank so the connection between the valve and the gas inlet won’t cause sharp bends or kinks in the hose.

<table>
<thead>
<tr>
<th><img src="" alt="WARNING" /></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WARNING</strong></td>
</tr>
<tr>
<td>Do not start generator if you smell propane. This may result in explosion hazard. Do not use provided LPG hose for any other appliances. Always turn off the propane tank and disconnect LPG hose when not in use.</td>
</tr>
</tbody>
</table>

**CONNECTING TO STANDARD LPG/PROPANE TANK**

**BEFORE CONNECTING PROPANE TANK TO THE GENERATOR**

**PLEASE REVIEW FUEL SAFETY SECTION ON PAGE 9**

**Connecting LPG Tank**

1. Make sure the generator is off, on a flat surface in well ventilated area.
2. Make sure propane tank valve is in the off position.
3. Make sure the fuel selector switch on the generator control panel is pointing downward to “Propane”.
4. Remove the plastic cover on the generator propane inlet valve.
5. Using your fingers tighten the LPG hose (included) end below to the generator propane inlet. DO NOT OVER-TIGHTEN 35-88 lb-in maximum.
6. Attach the other end of the hose to a tank of LPG/Propane and hand tighten.
7. Check all connections for leaks by wetting the fittings with soapy water. Anywhere that bubbles appear or grow indicates a leak in the connection. If a leak exists at a fitting then turn off the tank valve and tighten the fitting. Turn the gas back on and recheck with soapy water again. If the leak continues or if the leak is not at a fitting then do not use the generator and contact customer service.

**CAUTION**

Avoid prolonged breathing of gasoline vapors.
**OPERATION**

**CONNECTING TO LARGE LPG/PROPANE TANK**

**STOP**

BEFORE CONNECTING PROPANE TANK TO THE GENERATOR PLEASE REVIEW FUEL SAFETY SECTION ON PAGE 9

You can hook up your Dual Fuel Generator to a large home LP tank. It is required that you consult a plumber to properly connect your generator to the tank.

To properly connect with a large propane tank you must first check and confirm the LP fuel pressure at the outlet of the LP tank. The LP fuel pressure should be 14-10" of water column, which is the standard fuel pressure for residential gas fired appliances.

If the LP fuel pressure is within the 14-10" water column range, the primary fuel regulator should be removed from the fuel line components. Then plumb directly from the LP tank to the secondary regulator assembled to the generator.

**WARNING**

You must consult a certified plumber to connect to large LP tank safely.

**BEFORE STARTING THE GENERATOR**

**STOP**

BEFORE STARTING THE GENERATOR, REVIEW SAFETY SECTION STARTING ON PAGE 5.

Before attempting to start the generator, verify the following:

- The engine is filled with engine oil. See Checking Engine Oil on page 26.
- The generator is situated in a proper location (Location Selection on page 16).
- The generator is on a dry surface (Weather and Dry Surface on page 16).
- All loads are disconnected from the generator (No Connected Loads on page 16).
- The generator is properly grounded the Generator (page 16).
- Propane connection is secure with no leaks or damage. See Connecting LPG Tank on page 19.

**SWITCHING FUEL SOURCES**

**STOP**

BEFORE ADDING GAS TO THE TANK PLEASE REVIEW FUEL SAFETY SECTION ON PAGE 9

The below assumes that the propane fuel line is already attached to the generator securely and safely.

While the unit is running simply turn the FUEL SELECTOR knob to the desired fuel source. If you want to switch from gasoline to propane make sure the propane tank valve is open before you switch. When you move from propane to gasoline shut the propane valve after you have switched to gas.

**NOTICE**

If you do not plan on operating the unit on propane do not leave the propane tank valve open. When starting on propane the engine may run rough for a few seconds while it purges gasoline in the carburetor.

If the engine fails when switching fuel sources simply restart the unit on the fuel source that you switched to.
PROGRAMMING THE GENERATOR FOR REMOTE START

NOTICE
The key fob included with the generator should come already paired with the unit. If it does not you can follow the directions below to reconnect. If your unit was shipped without a key fob please contact our customer support team.

WARNING
Always make sure the area around the generator is clear of bystanders before using the remote start to start the generator.
If you are running generator on Propane the generator cannot be stopped with remote start key fob.

The generator can be started remotely from up to a maximum of 109 yards (100 M) away using the remote start key fob with new, fully charged batteries in the key fob. As the batteries’ state of charge in the key fob reduces, the distance to start the generator will also reduce.

Before the generator can be started, an initial start-up procedure must be performed so the generator and the key fob recognize each other. If the key fob is replaced, you will need to go through this procedure with the new fob.

1. With the battery connected, turn the engine control switch to the RUN position. The yellow battery light will illuminate.

2. Push and hold the red REMOTE PAIRING button on the side of the control panel until the push button start (3) on the control panel illuminates red, then let go (see 17 on page 13 for location of button).

3. Press and hold the STOP (2) button on the remote start key fob until the red light on the push button start (3) goes out, then let go.

4. Press and hold the START (1) button on the remote start key fob until the red light on the push button start (3) goes out, then let go.

5. Press and hold the REMOTE PAIRING button until the red light on the push button start (3) goes out. The generator is now programmed to start remotely.

POWER OUTPUT AND DEMAND
The generator should not be run completely unloaded for extended periods otherwise the engine may be damaged. It is recommended that the generator should always be operated with at least one-third of its rated 120-Volt AC power output. 120-Volt AC devices have two different electric power demands that must be taken into consideration, namely the running power and the starting/peak power. Both are measured in Watts (typically abbreviated as “W”).

The steady state continuous load is the running power demand and this is often marked on the device near its model number or serial number. Sometimes the device might only be marked with its voltage (i.e. 120 V) and current draw (e.g. 6 Amp or 6 A), in which case the running power demand in Watts can be obtained by multiplying the voltage times the current, e.g. 120 V × 20 A = 2,400 W.

Simple resistive 120-Volt AC devices such as incandescent bulbs, toasters, heaters, etc. have no extra power demand when starting, and so their starting power demands are the same as their running power demands.

More complex 120-Volt AC devices containing inductive or capacitive elements such as electric motors have a momentary extra power demand when starting, which can be up to seven times the running power demand or more. Manufacturers of such devices rarely publish this starting power demand and so it’s often necessary to estimate it. A rule of thumb for devices fitted with an electric motor is to apply a starting power multiplier of 1.2 for small hand-held or portable devices and a value of 3.5 for larger stationary devices. For example, a 900 W angle grinder can be assumed to have a starting power demand of at least 1.2 × 900 W, which equals 1,080 W. Similarly, a 1,650 W air compressor can be assumed to have a starting power demand of at least 3.5 × 1,650 W, which equals 5,775 W.

To prevent overloading of the generator’s 120-Volt AC system:

1. Add up the running power demand of all the 120-Volt AC devices that will be connected to the generator at one time. This total must not be greater than the generator’s specified running power output.

2. Add up the running power demand again, but for the largest motor-driven device use the value of its starting power demand instead of its running power demand. This total must not be greater than the generator’s specified starting power output.

3. The total running power demand of all the devices that will be connected to any one of the generator’s outlets must not exceed the generator’s specified running power output or 3,700 W, whichever is the lesser.
OPERATION

ELECTRIC START
Be sure to check oil levels before starting. If it is the first time starting make sure to add oil (see Adding Engine Oil page 26).

1. Make sure nothing is plugged into power outlets
2. Verify the battery is properly installed and both battery cables are attached (see Connecting the Battery on page 12).
3. Make sure the circuit breakers are properly set (see Figure 8).

Figure 8 - Breakers
1 240/120V Main Circuit Breaker Operating Position
2 240/120V Main Circuit Breaker Tripped Position
3 120V Circuit Breaker Operating Position
4 120V Circuit Breaker Tripped Position

4. Select fuel source for start up:

FOR GASOLINE:
   a. Move the fuel shut off valve to the ON position (see Figure 9).
   b. Turn fuel selector knob to GASOLINE (see Figure 9).

FOR LPG/PROPANE:
   a. Make sure the LPG hose is safely secured from the generator to the tank (see Connecting the LPG Tank on page 19).
   b. Turn the fuel selector knob to PROPANE (see Figure 10).
   c. Fully open the valve on the propane tank.

5. Push the engine control switch into the RUN position (see Figure 11).

Figure 11 - Engine Control Switch - RUN

6. Push and hold the push button start until the generator starts, then release. If using remote start then hold down START on the remote key fob until the generator starts, then release.

The engine will automatically set the choke and begin the start sequence.
   • If the engine has started successfully the light indicator on the engine start button will turn green.
   • If the engine fails to start, the generator controls will attempt to start the engine two more times for a total of three attempts.
   • If the third attempt fails, the light on the engine start button will turn red.
   • If the engine has failed to start after three attempts the push button start can be pushed again to begin the automatic start sequence.
   • The engine control switch can be switched at any time during the automatic start sequence to abort the engine start attempt.

NOTE: If the cranking speed drops after each unsuccessful attempt, then the battery may not be adequately charged. You can alternatively start the generator using the recoil start as instructed in Manually Starting a Generator on page 23.

7. Plug in electric devices.
**MANUALLY STARTING THE GENERATOR**

Be sure to check oil levels before starting. If it is the first time starting make sure to add oil (see *Adding Engine Oil* page 26).

1. Make sure nothing is plugged into power outlets.
2. Make sure the circuit breakers are properly set (see Figure 8).
3. Select fuel source (see Step 4 on page 22).
4. Push the engine control switch into the RUN position (see Figure 11).
5. Manually set the choke:
   a. Cold Start: Close the choke by moving it right towards the front handle of the generator.
   b. Warm Start: Open the choke by moving it left towards the wheels of the generator.
6. Firmly grasp and pull the recoil handle slowly until you feel increased resistance. At this point, apply a rapid pull while pulling up and slightly away from the generator (see Figure 12).
7. Plug in electric devices.

**STOPPING THE GENERATOR**

**Normal Operation**

During normal operation, use the following steps to stop your generator:

1. Remove any connected loads from the control panel receptacles.
2. Allow the generator to run at “no load” to reduce and stabilize engine and alternator temperatures.
3. Choose from options below to stop the generator (see Figure 13):
   a. Position the engine control switch to STOP
   b. Hold push button start until the generator stops
   c. Hold the STOP button on the remote start key fob (Note: The generator will run for an additional 15 seconds as it goes through a cool down cycle before shutting off.)

**During an Emergency**

If there is an emergency and the generator must be stopped quickly, position the engine control switch to the STOP position immediately.

**NOTE** If you plan to store the generator after use, stop the generator by turning the fuel shutoff valve to the OFF position and allow the fuel to be consumed from the carburetor.

4. If running off of propane then close the propane valve. If running on gas turn the fuel shutoff valve to the OFF position.
BEFORE PERFORMING MAINTENANCE ON THE GENERATOR, REVIEW THE SAFETY SECTION STARTING ON PAGE 5, AS WELL AS THE FOLLOWING SAFETY MESSAGES.

WARNING

Avoid accidentally starting the generator during maintenance by removing the spark plug boot from the spark plug. For electric start generators, also disconnect the battery cables from the battery (disconnect the black negative (-) cable first) and place the cables away from the battery posts to avoid arcing.

Allow hot components to cool to the touch prior to performing any maintenance procedure.

Internal pressure can build in the engine crankcase while the engine is running. Removing the oil fill plug/dipstick while the engine is hot can cause extremely hot oil to spray out of the crankcase and can severely burn skin. Allow engine oil to cool for several minutes before removing the oil fill plug/dipstick.

Always perform maintenance in a well-ventilated area. Gasoline fuel and fuel vapors are extremely flammable and can ignite under certain conditions.

MAINTENANCE SCHEDULE

WARNING

Failure to perform periodic maintenance or not following maintenance procedures can cause the generator to malfunction and could result in death or serious injury.

NOTICE

Periodic maintenance intervals vary depending on generator operating conditions. Operating the generator under severe conditions, such as sustained high-load, high-temperature, or unusually wet or dusty environments, will require more frequent periodic maintenance. The intervals listed in the maintenance schedule should be treated only as a general guideline.

CAUTION

Avoid skin contact with engine oil or gasoline. Prolonged skin contact with engine oil or gasoline can be harmful. Frequent and prolonged contact with engine oil may cause skin cancer. Take protective measures and wear protective clothing and equipment. Wash all exposed skin with soap and water.

Following the maintenance schedule is important to keep the generator in good operating condition. The following is a summary of maintenance items by periodic maintenance intervals.

CLEANING THE SPARK ARRESTOR

![WARNING]

Hot Surfaces. When operating machine, do not touch hot surfaces. Keep machine away from combustibles during use. Hot surfaces could result in severe burns or fire.

Check and clean the spark arrestor after every 100 hours of use or 6 months.

1. Generator must be cold to perform this maintenance.
2. Move the inverter to a flat, level surface.
3. Remove the 6 screws holding the muffler cover in place (see Figure 14).
4. Once the cover is removed, locate the screw on the tip of the muffler and remove. Pull the spark arrestor out of the muffler. (see Figure 15).
5. If the spark arrestor screen shows signs of wear (rips, tears or large openings in the screen), replace the spark arrestor screen. **NOTE:** Only use Westinghouse spark arrestors as replacements.
6. If screen is not torn then clean using a wire brush, commercial solvent, or compressed air. Remove any dirt and debris that may have collected on the spark arrestor screen (see Figure 16).
7. Install the spark arrestor back into the muffler. Make sure to fully push it in so that it is tight on the tip of the muffler.
8. Replace the muffler cover and tighten all 6 screws.

DRAINING CARBURETOR FLOAT BOWL

1. Make sure the generator is off and you are away from any open flames.
2. Place pan (or suitable container) under the carburetor assembly.
3. Loosen screw at bottom of the bowl and allow gas to drain out.
4. After all the gas has drained out, tighten the screw.
ENGINE OIL MAINTENANCE

Engine Oil Specification

1. Only use the engine oil specified in Figure 17.
2. Only use 4-stroke/cycle engine oil. **NEVER USE 2-STROKE/CYCLE OIL**. Synthetic oil is an acceptable substitute for conventional oil.

![Figure 17 - Recommended Oil](image)

CHECKING ENGINE OIL

**NOTICE**
Always maintain proper engine oil level. Failure to maintain proper engine oil level could result in severe damage to the engine and/or shorten the life of the engine. Always use the specified engine oil. Failure to use the specified engine oil can cause accelerated wear and/or shorten the life of the engine.

Engine oil level should be checked before every use.

1. Always operate or maintain the generator on a flat surface.
2. Stop engine if running.
3. Let engine sit and cool for several minutes (allow crankcase pressure to equalize).
4. With a damp rag, clean around the oil fill plug/dipstick.
5. Remove oil fill plug/dipstick (see Figure 18 below).
6. Check oil level: When checking the engine oil, remove the oil fill plug/dipstick and wipe it clean. Thread the oil fill plug/dipstick all the way back in and then remove and check the oil level on the oil fill plug/dipstick.
   - **Acceptable Oil Level** – Oil is visible on the crosshatches between the H and L lines on the oil fill plug/dipstick (see Figure 19).
   - **Low Oil** – Oil is below the L line on the oil fill plug/dipstick.

![Figure 19 - Checking Oil Level](image)

ADDING ENGINE OIL

1. Always operate or maintain the generator on a flat surface.
2. Stop engine if running.
3. Let engine sit and cool for several minutes (allow crankcase pressure to equalize).
4. Thoroughly clean around the oil fill plug/dipstick.
5. Remove oil fill plug/dipstick and wipe clean.
6. Select the proper engine oil as specified in Figure 17.
7. Using the supplied funnel, slowly add engine oil to the engine. Stop frequently to check the level to avoid overfilling.
8. Continue to add oil until the oil is at the correct level. See Figure 19.
9. Replace the oil fill plug/dipstick.

![Figure 18 - Oil Fill Plug/Dipstick](image)
MAINTENANCE

CHANGING ENGINE OIL

1. Always operate or maintain the generator on a flat surface.
2. Stop the engine.
3. Let engine sit and cool for several minutes (allow crankcase pressure to equalize).
4. Place oil pan (or suitable container) under the oil drain plug (see Figure 20).
5. With a damp rag, thoroughly clean around the oil drain plug.
6. Remove the oil drain plug (see Figure 20). Once removed, place the oil drain plug on a clean surface.
7. Allow oil to completely drain.
8. Replace oil drain plug.
9. Fill crankcase with oil following the steps outlined in Adding Engine Oil on page 26.

NOTICE
Never dispose of used engine oil by dumping the oil into a sewer, on the ground, or into ground water or waterways. Always be environmentally responsible. Follow the guidelines of the EPA or other governmental agencies for proper disposal of hazardous materials. Consult local authorities or reclamation facility.

AIR FILTER MAINTENANCE

WARNING
Never use gasoline or other flammable solvents to clean the air filter. Use only household detergent soap to clean the air filter.

Cleaning the Air Filter
The air filter must be cleaned after every 50 hours of use or 3 months (frequency should be increased if generator is operated in a dusty environment).

1. Turn off the generator and let it cool for several minutes if running.
2. Move the generator to a flat, level surface.
3. Unclip the clips on the top and bottom of the air filter cover (Figure 21).
4. Remove the black coarse air filters.
5. Wash the foam air filter elements by submerging the elements in a solution of household detergent soap and warm water. Slowly squeeze the foam to thoroughly clean.
6. Rinse in clean water by submerging the air filter elements in fresh water and applying a slow squeezing action.

NOTICE
NEVER twist or tear the foam air filter element during cleaning or drying. Only apply slow but firm squeezing action.

Figure 20 - Oil Drain Plug

Figure 21 - Unclip air filter

Westinghouse Portable Power | 27
Cleaning the Air Filter - Continued from Page 27

7. Dispose of used soap cleaning solution properly.

8. Dry the air filter elements by again applying a slow firm squeezing action.

9. Once the air filters are dry, coat the air filters with clean engine oil (see Figure 22).

10. Squeeze the filters to remove any excess oil.

11. Install the filters back into the unit. Make sure the gray (fine) air filter goes in first followed by the black (coarse) air filter on the outside.

12. Install the air filter cover and secure the air filter assembly.

SPARK PLUG MAINTENANCE

The spark plug must be checked and cleaned after every 100 hours of use or 6 months and must be replaced after 300 hours of use or every year.

1. Stop the generator and let it cool for several minutes if running.

2. Move the generator to a flat, level surface.

3. Remove the spark plug boot by firmly pulling the plastic spark plug boot handle directly away from the engine (see Figure 23).

4. Clean area around the spark plug.

5. Using the 13/16” spark plug socket wrench provided, remove the spark plug from the cylinder head.

6. Place a clean rag over the opening created by the removal of the spark plug to make sure no dirt can get into the combustion chamber.

Inspect the spark plug for:

- Cracked or chipped insulator
- Excessive wear
- Spark plug gap (the acceptable limit of 0.027–0.032 in. [0.70 – 0.80 mm]).

7. Install the spark plug by carefully following the steps outlined below:
   a. Carefully insert the spark plug back into the cylinder head. Hand-thread the spark plug until it bottoms out.
   b. Using the 13/16” spark plug socket wrench provided, turn the spark plug to ensure it is fully seated.
   c. Replace the spark plug boot, making sure the boot fully engages the spark plug’s tip.

Recommended Spark Plug Replacement:

- NGK: (1034) BP7ES (Replacement)
- Torch: F7TC (OE Spark Plug)
- Westinghouse Part Number: 180526
MAINTENANCE

CHECKING AND ADJUSTING VALVE LASH

**CAUTION**

Checking and adjusting valve lash must be done when the engine is cold.

1. Remove the rocker arm cover and carefully remove the gasket. If the gasket is torn or damaged, it must be replaced.

2. Remove the spark plug so the engine can be rotated more easily.

3. Rotate the engine to top dead center (TDC) of the compression stroke. Looking through the spark plug hole, the piston should be at the top.

4. Both the rocker arms should be loose at TDC on the compression stroke. If they are not, rotate the engine 360°.

5. Insert a feeler gauge between the rocker arm and the push rod and check for clearance (see Figure 24). See Table 3 for valve lash specifications.

6. If an adjustment is required, hold the adjusting nut and loosen the jam nut.

7. Turn the adjusting nut to obtain the correct valve lash. When the valve lash is correct, hold the adjusting nut and tighten the jam nut to 106 in-lb (12 N•m).

8. Recheck the valve lash after tightening the jam nut.

9. Perform this procedure for both the intake and exhaust valves.

10. Install the rocker arm cover, gasket and spark plug.

TESTING GFCI OUTLETS

1. Start the generator and allow it to warm up.

2. Press the test button on the GFCI outlet.

3. The reset button should pop out and there will be no power from the outlets. If the reset button does not pop out, the GFCI outlet is not working correctly and must be repaired before the generator can be operated.

4. Press the reset button to restore power to the outlet.

BATTERY SERVICE

**WARNING**

Do not charge for over 8 hours. Leaving the charger plugged in indefinitely could overcharge the battery and lead to battery failure.

To ensure the battery remains charged, the generator should be started every 2 to 3 months and run for a minimum of 15 minutes or a charger should be plugged into the generator and the generator should be charged overnight. Make sure the engine control switch is in the STOP position when charging. Plug the cord from the charger into the charging port on the generator control panel. Plug the charger into a 110/120-volt AC outlet.

MAINTENANCE

BATTERY REPLACEMENT
1. Remove the spark plug wire from spark plug.
2. Loosen and remove the bolt on the battery hold-down plate and swing the plate out.
3. Tip the battery forward slightly to access battery cables.
4. Disconnect the black negative (-) battery cable from the battery first.
5. Disconnect the red positive (+) battery cable second and remove the battery.

NOTICE
Dispose of the used battery properly according to the guidelines established by your local or state government.

6. Install the new battery into the generator frame.
7. Connect the red positive (+) battery cable to the battery first.
8. Connect the black negative (-) battery cable to the battery second.
9. Install the battery hold-down plate using the nuts removed in step 2.
10. Install the spark plug wire onto spark plug.

See below for the battery specification when replacing the battery.

CLEANING THE GENERATOR

It is important to inspect and clean the generator before every use.

Clean All Engine Air Inlet and Outlet Ports – Make sure all engine air inlet and outlet ports are clean of any dirt and debris to ensure the engine does not run hot.

Clean All Engine Cooling Fins – Use a damp rag and a brush to loosen and remove all dirt on or around the engine’s cooling fins.

Clean All Alternator Cooling Air Inlets and Exhaust Ports – Make sure the cooling air inlets and exhaust ports of the alternator are free of any debris and obstructions. Use a vacuum cleaner to remove dirt and debris stuck in the cooling air inlets and exhaust ports.

General Cleaning of the Generator – Use a damp rag to clean all remaining surfaces.

STORING GENERATOR

WARNING
Never store a generator with fuel in the tank indoors or in a poorly ventilated area where the fumes can come in contact with an ignition source such as: 1) pilot light of a stove, water heater, clothes dryer or any other gas appliance; or 2) spark from an electric appliance.

NOTICE
Gasoline stored for as little as 60 days can go bad, causing gum, varnish and corrosive buildup in fuel lines, fuel passages and the engine. This corrosive buildup restricts the flow of fuel, preventing an engine from starting after a prolonged storage period.

Proper care should be taken to prepare the generator for any storage.

1. Make sure the Engine Switch is switched to STOP so the generator does not draw power from battery.
2. Clean the generator as outlined in Cleaning the Generator.
3. Drain all gasoline from the fuel tank as best as possible.
4. With the fuel shut off valve open, start the engine and allow the generator to run until all the remaining gasoline in the fuel lines and carburetor is consumed and the engine shuts off. If you used propane the last time you ran the generator: start the unit up with propane then shut off the propane tank valve allowing the engine to use up all the remaining propane in the carburetor before it shuts off.
5. Close the fuel shut off valve.
6. Drain the remaining gas in the carburetor float bowl outlined in Draining Carburetor Float Bowl on page 25.
7. Change the oil (see Changing Engine Oil on page 27).
8. Remove the spark plug (see Spark Plug Maintenance on page 28) and place about 1 tablespoon of oil in the spark plug opening. While placing a clean rag over the spark plug opening, slowly pull there coil handle to allow the engine to turn over several times. This will distribute the oil and protect the cylinder wall from corroding during storage.
9. Replace the spark plug (see Spark Plug Maintenance on page 28).
10. Move the generator to a clean, dry place for storage.
### WARNING

Before attempting to service or troubleshoot the generator, the owner or service technician must first read the owner's manual and understand and follow all safety instructions. Failure to follow all instructions may result in conditions that can lead to voiding of the EPA certification or product warranty, serious personal injury, property damage or even death.

<thead>
<tr>
<th>PROBLEM</th>
<th>POTENTIAL CAUSE</th>
<th>SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Engine is running, but no electrical output</strong></td>
<td>1. Circuit breakers are tripped.</td>
<td>1. Reset the circuit breakers and check for overload condition.</td>
</tr>
<tr>
<td></td>
<td>2. The power cord’s plug connector is not fully engaged in the generator’s outlet.</td>
<td>2. Verify plug connector is firmly engaged in the generator’s outlet. If using the 240V outlet, make sure plug connector is rotated 1/4 turn in the clockwise direction.</td>
</tr>
<tr>
<td></td>
<td>3. Faulty or defective power cord</td>
<td>3. Replace power cord.</td>
</tr>
<tr>
<td></td>
<td>4. Faulty or defective electrical appliance</td>
<td>4. Try connecting a known good appliance to verify the generator is producing electrical power.</td>
</tr>
<tr>
<td></td>
<td>5. GFCI outlet is tripped</td>
<td>5. Press the reset button on the GFCI outlet.</td>
</tr>
<tr>
<td></td>
<td>6. If trying 1-5 above does not solve the problem, the cause might be the generator has a fault.</td>
<td>6. Take the generator to your nearest authorized service dealer.</td>
</tr>
<tr>
<td><strong>Engine will not start or remain running while trying to start.</strong></td>
<td>1. Fuel shutoff valve is in the OFF position.</td>
<td>1. Move the fuel shut off valve to the ON position.</td>
</tr>
<tr>
<td></td>
<td>2. Generator is out of gasoline.</td>
<td>2. Add gasoline to the generator.</td>
</tr>
<tr>
<td></td>
<td>3. Fuel flow is obstructed.</td>
<td>3. Inspect and clean fuel delivery passages.</td>
</tr>
<tr>
<td></td>
<td>4. Starting battery may have insufficient charge</td>
<td>4. On electric start models only. Check battery output and charge battery as necessary.</td>
</tr>
<tr>
<td></td>
<td>5. Dirty air filter</td>
<td>5. Check and clean the air filter.</td>
</tr>
<tr>
<td></td>
<td>6. Low oil level shut down switch is preventing the unit from starting.</td>
<td>6. Check oil level and add oil if necessary.</td>
</tr>
<tr>
<td></td>

<td>7. Firmly push down on the spark plug boot to ensure the boot is fully engaged</td>
</tr>
<tr>
<td></td>
<td>8. Spark plug is faulty.</td>
<td>8. Remove and check the spark plug. Replace if faulty.</td>
</tr>
<tr>
<td></td>
<td>11. If trying 1-10 above does not solve the problem, the cause might be the generator has a fault.</td>
<td>11. Take the generator to your nearest authorized service dealer.</td>
</tr>
<tr>
<td><strong>Generator suddenly stops running.</strong></td>
<td>1. Generator is out of fuel.</td>
<td>1. Check fuel level. Add fuel if necessary.</td>
</tr>
<tr>
<td></td>
<td>2. The low oil shut down switch has stopped the engine.</td>
<td>2. Check oil level and add oil if necessary.</td>
</tr>
<tr>
<td></td>
<td>3. Too much load</td>
<td>3. Restart the generator and reduce the load.</td>
</tr>
<tr>
<td></td>
<td>4. If trying 1-3 above does not solve the problem, the cause might be a fault in the generator.</td>
<td>4. Take the generator to your nearest authorized service dealer.</td>
</tr>
</tbody>
</table>
## TROUBLESHOOTING

<table>
<thead>
<tr>
<th>PROBLEM</th>
<th>POTENTIAL CAUSE</th>
<th>SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine runs erratic; does not hold a steady RPM.</td>
<td>1. Dirty air filter</td>
<td>1. Clean the air filter.</td>
</tr>
<tr>
<td></td>
<td>2. Applied loads maybe cycling on and off</td>
<td>2. As applied loads cycle, changes in engine speed may occur; this is a normal condition.</td>
</tr>
<tr>
<td></td>
<td>3. If trying 1-3 above does not solve the problem, the cause might be a fault in the generator</td>
<td>3. Take the generator to your nearest authorized service dealer.</td>
</tr>
<tr>
<td>Push button start is not working and the cranking speed drops after each attempt.</td>
<td>1. Battery is not adequately charged</td>
<td>1. Turn the engine switch to “STOP” and hook up the battery charger for 1 hour.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Try manually starting the generator to let the battery charge while it is operating.</td>
</tr>
<tr>
<td>Frost on the propane tank or regulator</td>
<td>1. This can be a normal occurrence caused when liquid propane changes phase to a gas. As this process occurs the fuel tank or regulator will cool and allow humid air surrounding the propane tank or regulator to condense into frost.</td>
<td>1. As this can be normal, providing all the propane fuel handling equipment is functioning normally, no remedy is needed.</td>
</tr>
<tr>
<td></td>
<td>2. The propane tank is not equipped with a OPD (rollover protection device) and has been stored in a horizontal position allowing liquid propane to enter the downstream fuel handling equipment.</td>
<td>2. If you suspect your propane fuel tank is not equipped with a OPD device, discontinue operation immediately and replace the propane fuel tank with a propane tank equipped with a roll over protection device.</td>
</tr>
<tr>
<td></td>
<td>3. Propane fuel tank over filled.</td>
<td>3. If you suspect your propane fuel tank has been overfilled, discontinue operation immediately and return the propane fuel tank to the place of purchase or refilling.</td>
</tr>
<tr>
<td>Propane fuel smell</td>
<td>1. Fuel regulator or fuel hose and fittings not securely sealed.</td>
<td>1. Using a soap solution check each connection and tighten as needed.</td>
</tr>
<tr>
<td></td>
<td>2. Propane fuel regulator vent active.</td>
<td>2. The propane fuel regulator is equipped with a small vent that will allow a small amount of propane fuel vapor to escape from the regulator when the propane tank valve is opened. This can be normal providing the venting of the propane is brief. If you suspect that this is abnormal, immediately discontinue use and have the propane regulator inspected by a qualified technician.</td>
</tr>
<tr>
<td></td>
<td>3. Residual fuel from the carburetor dispersing after operation.</td>
<td>3. Normal, no remedy is needed.</td>
</tr>
<tr>
<td>Poor performance or engine stalling</td>
<td>1. Propane fuel line kinked or crushed.</td>
<td>1. Inspect propane fuel line and remove kinks or other obstructions.</td>
</tr>
<tr>
<td></td>
<td>2. Fuel selector valve not properly positioned.</td>
<td>2. Rotate the fuel valve fully until the pointer is directly in line with the desired fuel.</td>
</tr>
<tr>
<td></td>
<td>3. Gasoline not purged from the carburetor before switching to propane.</td>
<td>3. Turn the propane fuel tank valve to closed. Move the fuel selector valve to propane. Turn the gasoline fuel valve to off. Start the engine and allow the engine to run until the fuel has been consumed in the carburetor. Begin propane start up procedure.</td>
</tr>
